Test Case: Start button
- Test should explore the full functionality of the start button.
- Steps:
    - Open up app in http://localhost:4000.
    - Click on the Start Button.
    - The game of tic tac toe should start and users should be able to start playing.

Test Case : AI interaction
- Tests should explore multiple ways the AI (opposing player moves) is interacting with the user's input.
- Steps:
    - Click on the start button
    - Run(play) a few games and notice AI functionality
    - AI should run smooth with any bugs

Test Case : Winner response
- This test should give user feedback on who wins the game, the "X" player or the "O" player.
- Steps:
    - Click the start button
    - Complete a full match
    - Once the game is finished there should be a message above the table stating who is the winner.

Bug reports:
1. The game does not state the winner of the match properly. When the X player wins there's a feedback message stating that the X player lost.

2. The user input is very buggy causing the X and O players to skip each other's turn. This is making the game unfair due to its input bugs.
3. The center left box is automatically inputting a lower case "o" even when the X player is already in that spot. When the X player decides to play the center box the center left box will automatically change from an X to an "o". All inputs should be capitalized as well.
